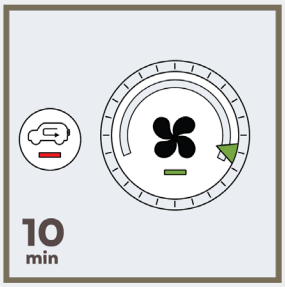
Test & Treat Vehicles for Mold

How-To Treat and Clean

Follow this step-by-step guide two times in the first week and then monthly to maintain low mold, yeast, and bacteria levels.



Run Fans For 10 Minutes

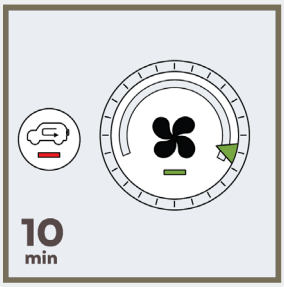
Turn your vehicle's temperature control fan on high and turn off the re-circulation of the temperature control system. Allow vents to circulate outside air into the car for 10 minutes.

Wipe Intake Vents

Pass a tissue over the outside air intake at the base of the windshield wipers.

Spray Intake Vents

Identify spots where the vents suck in the most air by passing a tissue over the vents. Spray a large amount of Remedy Mold Treatment Spray in those spots.



Run Fans Again

Leave the doors closed and the fan on for 10 minutes.

Spray Inside With Remedy

Spray the entire inside of the car including vents, headliner, seats, carpeting, and the trunk. Let the inside air-dry.

Test For Mold

Perform a one-hour mold test with gravity plates to determine effectiveness of the treatment.
